

The **CARMA Clinic** at the Health Sciences Centre is a consultation service that provides assessment, diagnostic clarification, and treatment recommendations for problematic substance use including prescription medications, illicit substances, and/or alcohol, where medical review is warranted. The Clinic liaises with the HSC Addictions Unit and community-based treatment programs to coordinate treatment plans, as needed. The CARMA Clinic may make recommendations about prescribing and polypharmacy, but **does not take over prescribing of medications**.

Referral Process

Physician referrals are requested from primary/prescribing physicians. Exceptions will be made for referrals from Emergency, providing that the ER physician has spoken with the patient and prescribing physician and they are in agreement with the referral.

Referrals should outline the patient's medical history, addiction history, current substance use, and prescribed medications. Referrals should include results from tests or consultations related to chronic pain, psychiatric issues, or other relevant medical issues. Please enclose recent lab results including a comprehensive urine drug screen, CBC, glucose, urea, creatinine, AST, ALT, GGT, TSH, and any other relevant investigations. **Referrals must include the patient's current contact information.**

Referrals can be sent to the CARMA Clinic at fax (204) 787-3996.

Waitlist

The waitlist is variable. Typically, the wait time for assessment is 1-3 months. Priority is given to individuals who are pregnant and individuals who have already initiated treatment planning with a community addictions agency. For more information, contact the CARMA Clinic Liaison, Carmen Taylor O.T. Reg. (MB) via phone at **(204) 787-2482**.

Treatment & Interim Options

Based on a comprehensive assessment and/or diagnosis of substance use disorder, the CARMA Clinic may recommend **opioid agonist therapy (OAT)** for opioid use disorder with buprenorphine/naloxone (Suboxone) or methadone, provide **taper or relapse-prevention medication recommendations**, and/or recommend **abstinence-based treatment** options. Recommendations may include suggestions for treatment of other co-occurring issues affecting recovery.

Please note treatment options in the community have their own respective waitlists. While the patient is waiting for an appointment with the CARMA Clinic, we strongly recommend they explore other resources:

- If the individual is overusing/misusing opioids, they should self-refer to **OAT Clinics** in the community (contact information listed below). Even if they are unable to schedule an intake appointment, they should place their names on the clinic waiting lists.
- They can also refer themselves to **Community Addiction Treatment Agencies** to initiate treatment planning (contact information listed below). Individuals can also attend the **Substance Use Support Groups** listed for immediate peer support.
- For individuals with chronic pain and overuse/misuse of prescribed pain medications, a Pain Clinic referral should be considered. We also recommend that if any investigations are required to rule out organic cause for chronic pain that these be initiated.
- If the patient is frequently seeking early refills we suggest limiting the amount prescribed at one time, with restricted dispensing intervals, a therapeutic agreement, and use of urine drug screening for monitoring of prescribed/illicit drug use.
- Please order a comprehensive urine drug screen; results can be sent with the referral or forwarded upon receipt. A comprehensive UDS has advantages over a street UDS as it specifically identifies which drugs/medications a patient is, or is not, taking.
